detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13633 to AAH18742 represent human cDNA sequences; AAB92446 to AAB95893 represent human amino acid sequences, and AAH13629 to AAH13632 represent oligonuclectides, all of which are used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs.

Where a primer set comprises:

(a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polymocleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polymucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a polymucleotide which comprises a 3'-end sequence complementary to a ligonucleotide which comprises a 1'-end sequence, where the oligonucleotide comprises a 1'-end sequence, where the oligonucleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primers can be used in antiense therapy and in the gene therapy. The primers are useful for synthesising polynucleotides,
                                                                                                                                     180
                                                                                                                                                                               180

SEQ ID NO 15335; 2537pp + Sequence Listing; English.

The present invention describes primer sets for synthesising 5602 full
[1 length cDNAs defined in the specification. Where a primer set comprises:

[2] an oligo-dr primer and an oligonnclectide comprises one of the complementary strand of a polynuclectide which comprises one of the 5602 nucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonuclectide comprises a sequence complementary to the complementary strand of a polynuclectide which comprises a 5'-end sequence and an oligonuclectide comprising a sequence complementary to the complementary strand of a polynuclectide which comprises a 5'-end sequence and an oligonuclectide comprising a sequence complementary to a polynuclectide which comprises a 3'-end sequence.

[2] Sequence and an oligonuclectide comprises a 5'-end sequence of complementary to a polynuclectide which comprises a 1'-end sequence.

[3] Sepecification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynuclectides, particularly full-length cDNAs. The primers are also useful for the compression and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers are also useful for the CDNAs easily without any specialised methods. AAH13628 and AAH13631 represent human amino acid sequences; and AAH13632 represent complementary and in the exemplification of the constant of the constan

Claim 20; Page 167-168; 1963pp; English.

Sequences ABB10981-ABB12310 represent 1350 novel human polypeptides, and sequences ABB10981-ABB12310 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the nucleotides of the invention, methods of producing the nucleotides or polypeptides in a sample, and methods of identifying compounds which bind to polypeptides of the invention. Although novel, many of the nucleotides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence to polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence all protein all therapeutic applications. The polypeptides of the invention may chave various activities; including cytokine, cell proliferation or cell differentiation activity; activities; haematopolesis regulatory activity, itsue growth activity; immunomodulatory activity; activities; haematopolesis cancers, cancer cell proliferation or metastasis.

Cohemotactic or chemokinetic activities; haemostatic, thrombotic or thrombolytic activities, receptor or ligand activities; or may be used in morogenesis, cancer cell proliferation or metastasis.

Cohemotactic or chemokinetic activities, haematopoletic disorders (e.g., myeloid or lymphoid cell involved in oncogenesis, cancer or ligand activities or metastasis.

Conditions, e.g., by protein or gene therapy. Such conditions include conditions, e.g., by protein or gene therapy. Such conditions in activities, activities or metastasis.

Conditions, e.g., by protein or gene therapy. Such conditions are useful or disorders.

Conditions, e.g., by protein or gene therapy. Such conditions are used to prome the cell growth activity may be used to promoce wound the present set of properties and undersely activities may be used in the treatment of viral, becausing techniques. The present sequence represents a novel human colle polypeptide of the invention

cc activity, and methods of screening individuals for a predisposition to an OREX-associated disorder. The OREX proteins of the invention have a wide range of biological activities, such as cytokine, cell proliferation, cell differentiation, immune modulation, haematopoiesis regulation, tissue growth, angiogenesis, activin or inhibin activity, chemotactic chemokinetic activity, haemostatic activity, thrombolytic activity, creeptor/ligand, antiinflammatory activity, thrombolytic activity, components activity, and may also be involved in the determination of bodily characteristics, fettility and behaviour. OREX proteins, other proliferative disorders such as psoriasis and benign tumours, cother proliferative disorders such as spiepsy and Alzheimer, s disease, cardiovascular diseases, immune system disorders, disorders related to organ transplantation, disorders of tissue growth and regeneration, disorders and infectious diseases caused by viral, bacterial, currange disease, and infectious diseases caused by viral, bacterial, currange disease, in the identification of OREX genomic sequences or transcripts, in the identification and cloning of homologous currangerial for studying the function and/or activity of OREX mich may be useful for studying the function and/or activity of OREX pharmers and monitorial and in the real mention and contained by useful in the identification and cloning sectivity of OREX pharmers are specific antibodies, which are useful in the identification delegates useful in the identification delegates useful in the identification delegates are useful in the identification delegates are useful in the identification delegates useful in the identification delegates useful delegates are also delegates.

designated ORF (open reading frame) 1.4534, and sequences ABN75054-ABN75057 represent cDNAs encoding them. The invention also encompasses polypeptides at least 80% identical to the ORF-ORF4534 (collectively referred to as ORFX) proteins, polynucleotides at least 85% identical to the ORFX nucleic acid sequences, vectors and host cells comprising ORFX polynucleotides, the recombinant production of ORFX proteins, antibodies specific for ORFX proteins, methods of detecting ORFX polynucleotides and polypeptides, methods of screening for modulators of ORFX expression or

Sequences ABP31028-ABP35561 represent 4534 novel human proteins

Claim 10; Page 2350; 2508pp; English.

transplantation

Novel human polypeptides and polynucleotides useful for diagnosing, preventing and treating cardiovascular disease, neurodegenerative, hyperproliferative disorders and disorders related to organ

N-PSDB; ABN79266.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                               194
                                                                 The invention relates to isolated lung tumour-specific proteins and their corresponding cDNA molecules. Lung tumour-specific proteins and their antigen-presenting cells are useful for stimulating and/or expanding T cells specific for a tumour protein, and for inhibiting the development of cancer. The invention also relates to a composition useful for stimulating an immune response, and for treating cancer. The lung tumour specific oligonucleotide is useful in gene therapy and for diagnosis, detection and treatment of lung cancer. The present sequence is human

The invention relates to a novel isolated polynucleotide comprising one of 32 47-6080 base pair sequences, given in the specification, or their complements or degenerate variants, at least 20 contiguous residues of a caquence in, or having at least 75 or 90 % identity with the isolated polynucleotide, or that hybridise with the polynucleotide. The invention further comprises: an isolated polypeptide, an expression vector comprising the polynucleotide operably linked to an expression control sequence; a host cell transformed or transfected with the expression vector; an isolated antibody or its antigan-binding fragment that presence of a cancer in a patient; a fusion protein comprising the polynucleotide antibody or its antigan-binding fragment that presence of a cancer in a patient; a fusion protein comprising the polynucleotide under moderately stringent conditions; a method for stimulating and/or expanding T cells specific for a tumour protein; an isolated an oligonucleotide that hybridises to the isolated consisting of carriers and immunostimulants and a second component; a method for stimulating an immune response in a patient; a method for treating cancer in a patient; a method for detection reagent comprising a reporter group; and a antibody and a detection reagent comprising a reporter group; and a method for inhibiting the development of cancer in a patient. The method for inhibiting the development of cancer in a patient. The method for inhibiting the development of cancer in a patient of cancer in a patient. The method for inhibiting the development of cancer in a patient of cancer in a patient. The

The invention relates to polynucleotides encoding lung tumour antigens.

The invention also relates to the polypeptides encoded by the polynucleotides, isolated antibodies or antigen-binding fragments that specifically bind the polypeptides and a method for detecting cancer in a patient, comprising obtaining a biological sample from the patient, contacting the sample with a binding agent that binds a polypeptide of contacting the sample with a binding agent that binds a polypeptide of binds to the binding agent, and comparing the amount of polypeptide to a predetermined cut-off value. T cells specific for a tumour protein can be stimulated and/or expanded by contacting the T cells with a polypeptide, polypeptide. Cancer development can be inhibited by incubating CD4+ and/or CD8+ T cells isolated from a patient with a polypeptide, or an antigen-presenting cell that expresses a polypeptide or an antigen-presenting cell that expresses a polypeptide, so that the T cells proliferate. The invention is used to stimulate an immune response or to detect or treat a cancer in a patient, partiend suplypeptide of the invention. Note: The sequence data for this patient did not form part of the printed specification but was obtained in electronic format from USPTO at sequence.yow/sequence.thml.

1218 ------PGTPRPTTVDPYSQQPQTPRPSTQTDLFVTPVTNQRHSDPYAHPPGT 1264 The invention relates to an isolated polynuclectide (I) comprising a nuclectide sequence selected from any of 948 sequences (ABZ1119-ABZ12066) or their mature protein coding portion, active domain coding protein or complementary sequences. The polynuclectides are useful for identifying expressed genes or for physical mapping of human genome. The encoded polypeptides (ABBG802-ABF69849) are useful as molecular weight markers, as a food supplement, for generating antibodies, in medical imaging, screening and diagnostic assays and for treating cellification solificative discasses (Cancer), neurodegenerative diseases (Parkinson's or Alzheimer's disease), autoimmune diseases (multiple sclerosis, diabetes, lupus) genetic disorders, myeloid or lymphoid disorders, 109 YCDESLFGSRSEGASFGAPRMAKGDAAKLRALLWTPPPTPRGSH--SPRPREAPLRAIHP 166 --PAADSQKLSMGGLHS----SRPL 194 Human; genome mapping; gene therapy; food supplement; virus; fungus; call-proliferative disorder; neurodegenerative disease; bacterial; Parkinson's disease; Alzheimer's disease; autoimmune disease; multiple sclerosis; diabetes; genetic disorder; wound; burn; infection; arthritis; cytostatic; immunomodulator; nootropic; neuroprotective; arthritis, antidiabetic; immunosuppressive; dermatological; haemostatic; vulnerary; fungicide; antibacterial; virucide; protozoacide; antiarthritic. New polynucleotides comprising sequences assembled from expressed sequence tags (ESTs), useful for treating cell-proliferative, neurodegenerative, autoimmune, genetic, myeloid or lymphoid, or platelet Ren F; 1159 AVNESFÄHPSRAFSQPGTISRPTSQDPYSQPPGTPRPVVDSYSQSSGTARSNTDPYSQP-195 KRGLSHSLTHLNVPSTGHPATSAPHTNGPQDLRPSTSGVTFRSPLVTSRARSVSISVPST Tang YT, Zhou P, Goodrich RW, Asundi V, Zhang J, Zhao QA, R Xue AJ, Yang Y, Ma Y, Yamazaki V, Chen R, Wang Z, Ghosh M; Wehrman T, Wang J, Wang D, Drmanac RT; Claim 9; SEQ ID NO 1783; 1012pp. + Sequence Listing; English. The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidaring cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form at directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RMAKGDAAKLRALLWTP-----PPTPRGSHSPRPREAPLRAIHPAGPSKTEPGPAADS

                                                          The invention relates to avilamycin derivatives (I) with antibacterial, virualide, procrozoacide and fungicide activity. (I) are useful for treatment of infections (bacterial, viral, procrozoal or fungal), in human or veterinary medicine, particularly where caused by Staphylococcus aureus: (I) are more hydrophilic than known avilamycins. The present sequence is that of an avilamycin synthesis enzyme from the Streptomyces viridochromogenes Avilamycin A biosynthetic gene cluster (ABZ37515.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention describes a method of identifying compounds that inhibit the activity of, or that interact with a protein essential for Drosophila larval viability comprising expressing in a recombinant host a DNA molecule to produce a protein essential for larval viability. The method is useful for identifying compounds with insecticidal activity. Compounds identified are useful as insecticides in crops such as maize, wheat, oats, rye, sorghum, rice, balley, millet, turf, cotton, sugarcane, sugar beet, oilseed rape, soybeans, vegetable crops and fruits. This is the amino acid sequence of a fruit fly larval viability associated protein
                                                                                                                                                                                                                                                                                                                                                                                                  11;

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain sequences. (I) is useful as hybridisation probes, polymerase chain creaction (PCR) primers, aligomers, and for chromesome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed control of (II) are useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful in genetical activity of (II) or to treat disease states involving (II). (II) is useful in riseus, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (II) and its binding partners are useful in medical imaging of sites expressing (II). (II) and its binding partners are useful for treating disorders in polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations of and to produce other types of data and products dependent on DNA and amino acid sequences. Abgolou-Agg30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in celectronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                153 SP-----RPREAPLRAIHPAG----PSKTEPGPAADSQKLSMGGLHSSRPLKRGLSHS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 324 APPGPPGRGRPARLPRRAAGPAGRRHRPDRGPPSPAAQRDPPRAAPRISRRSASR----

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention relates to a novel WASP interacting protein (WIP) and the DNA sequence which encodes it. In addition, the invention relates to a novel transgenic non-human mammal whose genome comprises a disruption of a WIP gene. Wiskott-Aldrich syndrome (WAS) is an X-linked immunodeficiency caused by mutations that affect the WAS protein (WASP). It is characterised by thrombocytopenia, eczema, impaired immunity and predisposition to develop lymphomas and leaukaemias. Modulation of the activity of a WIP protein, through use of a WIP agonist or WIP anatagonist, may produce cytostatic activity. The transgenic non-human mammal may be useful for enhanding or inhibiting T cell receptor-mediated T cell activation or B cell proliferation in a mammal for treating preventing diseases such as leukaemia. The present sequence is the amino acid sequence of the human WIP protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  143

The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAM36642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polymuclectides are useful in gene therapy. A composition containing a polypeptide or polymuclectide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous sistem closeds. System as peripheral nervous system diseases, such as alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic localised neuropathies and central nervous system diseases, such as Alzheimer's Parkinson's disease, Huntington's disease, amyotrophic acteristics such as: Immune system suppression, activity, chemoteactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemiss and CN.S disorders. Note: The sequence data for this patent did not form by the printed specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel nucleic acids and polypeptides, useful for treating disorders such as central nervous system injuries.
                                                                                                                            Human, nootropic, immunosuppressant, cytostatic; gene therapy, cancer, peripheral nervous system; neuropathy; central nervous system; CNS; Alzheimer's; Parkinson's disease; humrington's disease; heamostatic; amyotrophic lateral sclerosis; Shy-Drager Syndrome; chemotactic; chemotactic; thrombolytic; drug screening; arthritis; inflammation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ma Y,
Xue AJ,

Sequence 16754, Application US/09252991A

Patent No. 6551795

GENERAL INFORMATION:

APPLICANT: Marc J. Rubenfield et al.

APPLICANT: Marc J. Rubenfield et al.

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS

TITLE OF INVENTION: A ARRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: NUMBER: US/09/252,991A

CURRENT APPLICANTON NUMBER: US 60/074,788

PRIOR FILING DATE: 1998-02-18

PRIOR FILING DATE: 1998-02-18

PRIOR FILING DATE: 1998-02-18

PRIOR FILING DATE: 1998-02-18

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 26071, Application US/09252991A
Patent No. 6551795
GNDERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 107196.136
CURRENT APPLICATION NUMBER: US/09/252,991A
PRIOR APPLICATION NUMBER: US 60/074,788

| Sequence 28921, Application US/09252991A
| Patent No. 6551795
| GENERAL INFORMATION:
| GENERAL INFORMATION:
| TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS;
| TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS;
| TITLE OF INVENTION: ASSURING SAME FOR DIAGNOSTICS AND THERAPBUTICS
| CURRENT FILING DATE: 1999-102-18
| PRIOR FILING DATE: 1999-102-18
| PRIOR FILING DATE: 1998-02-18
| PRIOR FILING DATE: 1998-02-18
| PRIOR FILING DATE: 1998-07-27
